

Step 1

UPLOAD PHOTOS AND DIMENSIONS

1. Take photos.

Give ChatGPT views from each corner of your kitchen including:

- cabinetry and appliances
- windows and doors
- the island or peninsula
- sink and major plumbing locations
- adjacent spaces that affect how the kitchen flows

2. Upload a picture of a floor plan or use the included graph to draw one.

A builder's plan is great, but a measured hand-drawn sketch works too.

Label the dimensions and locations as clearly as possible.

Include the dimensions you know: wall lengths, ceiling height, door sizes, window sizes, appliances, sink location and island size/orientation.

3. Before you redesign anything, ask AI interpret the room. Copy & paste the below:

Prompt:

Study my uploaded kitchen photos and floor plan. Before redesigning anything, explain how you understand my existing kitchen, including the room dimensions, doors, windows, appliances, sink and island orientation. *Tell me anything you're unsure about and ask me questions before making changes.*

CHECK ITS ANSWER

Do not assume AI understood the room just because you uploaded a floor plan. Read its interpretation and correct anything it misunderstood before asking it to create a new image. It's important to get the general layout correct.
